Despite the urgent need for action, there is a widespread lack of understanding of the benefits of using green energy sources for not only reducing carbon emissions and climate change, but also for growing a sustainable economy and society. Future citizens of the world face increasing sustainability issues and need to be better prepared for energy transformation and sustainable future economic development. *Cases on Green Energy and Sustainable Development* is a critical research book that focuses on the important role renewable energy and energy efficiency play in energy transition and sustainable development and covers economic and promotion policies of major renewable energy and energy-efficiency technologies. Highlighting a wide range of topics such as economics, energy storage, and transportation technologies, this book is ideal for environmentalists, academicians, researchers, engineers, policymakers, and students.

With a focus on ecology, economy and engine performance, diesel engines are explored in relation to current research and developments. The prevalent trends in this development are outlined with particular focus on the most frequently used alternative fuels in diesel engines; the properties of various type of biodiesel and the concurrent improvement of diesel engine characteristics using numeric optimization alongside current investigation and research work in the field. Following of a short overview of engine control, aftertreatment and alternative fuels, *Green Diesel Engine* explores the effects of biodiesel usage on injection, fuel spray, combustion, and tribology characteristics, and engine performance. Additionally, optimization procedures of diesel engine characteristics are discussed using practical examples and each topic is corroborated and supported by current research and detailed illustrations. This thorough discussion provides a solid foundation in the current research but also a starting point for fresh ideas for engineers involved in developing/adjusting diesel engines for usage of alternative fuels, researchers in renewable energy, as well as to engineers, advanced undergraduates, and postgraduates.

This proceedings volume explores the concept of civil society as an engine for economic and social well-being. Featuring contributions from the 2017 Griffiths School of Management and IT Annual Conference on Business, Entrepreneurship and Ethics (GMSAC) held in Oradea, Romania, this volume provides different perspectives, emerging studies and trends that are crucial to the further understanding of the interconnection of civil society, economic development and social stability. The enclosed contributions address key topics such as a) the ways in which national, regional and local governments are best equipped to support economic and social development, b) how government, business and non-profit sectors can support economic and social stability and c) the ways in which growing economies' active societies can strengthen civil society. Research and practice have proven that there is a great potential for civil society organizations to support socio-economic well-being, both directly and indirectly. As a result, the interplay between civil society, economics and social well-being is highly relevant to current business and economic research and is a topic of discussion by academics and practitioners in the government, business and non-profit sectors. This volume showcases some of the current research, cases and discussions in this area from an interdisciplinary, global perspective. Featuring contributions exploring timely subjects such as consumer behavior, the hospitality industry, education, corporate social responsibility (CSR), banking, health care, and semiotics, this book is appropriate for researchers, academics and policy makers in economic and social development, business ethics and sustainability.

A writer's journal analyzes the creative process and the relationship between dreams and the imagination

Based on previsions, the reciprocating internal combustion engine will continue to be widely used in all sectors: transport, industry, and energy production. Therefore, its development, while complying with the limitations of pollutants as well as CO2 emission levels and maintaining or increasing performance, will certainly continue for the next few decades. In the last three decades, a significant effort has been made to reduce pollutant emission levels. More recently, attention has been given to CO2 emission levels too. It is widely recognized that one single technology will not completely solve the problem of CO2 emissions in the atmosphere. Rather, the different technologies already available will have to be integrated, and new technologies developed, to obtain substantial CO2 abatement.
