The present economic system requires us to consume and throw away more and more goods. Yet often it's our desire, and the best interests of the environment, for these goods to last. The contributors to this book, who comprise many of the most significant international thinkers in the field, explore how longer lasting products could offer enhanced value while reducing environmental impacts. If we created fewer but better quality products, looked after them carefully and invested more in repair, renovation and upgrading, would this direct our economy onto a more sustainable course? The solution sounds simple, yet it requires a seismic shift in how we think, whether as producers or consumers, and our voracious appetite for novelty. The complex range of issues associated with product life-spans demands a multidisciplinary approach. The book covers historical context, design, engineering, marketing, law, government policy, consumer behaviour and systems of provision. It addresses the whole range of consumer durables - vehicles, kitchen appliances, audio-visual equipment and other domestic products, furniture and floor coverings, hardware, garden tools, clothing, household textiles, recreational goods and DIY goods - as well as the re-use of packaging. Longer Lasting Products provides policy makers, those involved in product design, manufacturing and marketing, and all of us as consumers, with clear and compelling guidance as to how we can move away from a throwaway culture towards an economy sustained by more durable goods.

The efficient design of microwave food products and associated packaging materials for optimum food quality and safety requires knowledge of product dielectric properties and associated heating mechanisms, careful consideration of product geometry, knowledge of modern packaging and ingredient technologies, and application of computer simulation, statistics and experimental design. Integrated knowledge and efficient application of these tools is essential for those developing food products in this demanding field. Development of packaging and products for use in microwave ovens provides a focused and comprehensive review for developers. Part one discusses the principles of microwave heating and ovens, with an emphasis on the effect of food dielectric properties and geometry on heating uniformity and optimising the flavours and colours of microwave foods. Microwave packaging materials and design are discussed in Part two; chapters cover rigid packaging, susceptors and shielding. Product development, food, packaging and oven safety is the topic of Part three. Computer modelling of microwave products and active packaging is discussed in Part four. Written by a distinguished team of

international contributors, Development of packaging and products for use in microwave ovens is a valuable resource for those in the food and packaging industries. Comprehensively reviews the principles of microwave heating and ovens assessing the effect of food dielectric properties on heating uniformity Thoroughly reviews microwave packaging materials and design including testing and regulatory issues Features a seven page section of colour diagrams to show heat distributions

Do we need a new car or a new refrigerator every ten years? What happens to our PC which is exchanged for a new model every three years? Why do our shoes last only a year or so, while those of our great grandfather served for a generation? Are businesses deliberately marketing products in a way which encourages sub-optimal use and induces consumers to buy new products? More and more consumers respond "yes" objecting to the business practices which reduce the life span of a product or pay no attention to efficiency in consumption. The growing concern with sub-optimal use of consumer durables arises as a response to the volume of waste, as well as to the growing conviction that over-consumption is encouraged by marketing techniques and approaches that favor lesser durability and sub-optimal use. There are signs that those things will have to change. Firstly, client orientation - a condition sine qua non of marketing success in the saturated markets of rich countries - is gaining popularity. Consumers are better informed and more influential and "intelligent consumption" is on the rise. Buyers are becoming more and more hostile towards marketing manipulation, inducing them to consume faster, more and at higher prices. The public increasingly resists messages in advertisements (preventive resistance) which are predominantly persuasive (rather than educational or informative) and conceived to stimulate demand for the "new", the superficial and the fashionable.

This third edition of Radio-Frequency and Microwave Radiation Guide provides the most current and authoritative information on the physical characteristics of radio-frequency radiation (RF) and microwave radiation, its interactions with matter, and biological and environmental effects. Current standards and guidelines are discussed, as are instruments and controls. A handy glossary provides definitions of important terms, and an appendix presents a list of problems industrial hygienists and other health professionals may encounter.
