Internal combustion engines such as reciprocating internal combustion engines produce air pollution emissions, due to incomplete combustion of carbonaceous fuel. The main derivatives of the process are carbon dioxide CO₂, water and some soot—also called particulate matter (PM). The effects of inhaling particulate matter have been studied in humans and animals and include asthma, lung cancer, cardiovascular issues, and premature death.

The first practical and usable gas internal-combustion engine was designed by the French mechanical engineer E. Lenoir in 1860. In 1876 the German inventor N. Otto built an improved four-stroke gas engine. An internal-combustion engine is simpler than a steam engine, since one stage of power conversion—the steam-boiler system—is eliminated.
