This book is an introduction to the dynamics of reaction-diffusion systems, with a focus on fronts and stationary spatial patterns. Emphasis is on systems that are non-standard in the sense that either the transport is not simply classical diffusion (Brownian motion) or the system is not homogeneous. A important feature is the derivation of the basic phenomenological equations from the mesoscopic system properties.

A important feature is the derivation of the basic phenomenological equations from the mesoscopic system properties. Topics addressed include transport with inertia, described by persistent random walks and hyperbolic reaction-transport equations and transport by anomalous diffusion, in particular subdiffusion, where the mean square displacement grows sublinearly with time.

Reaction-Transport Systems Mesoscopic Foundations, Fronts ...

We strongly recommend such a mesoscopic approach to ensure that the reaction–transport equations studied are physically and mathematically sound. We present a comprehensive review of the mesoscopic foundations of reaction–transport equations in Chap. 3, which is at the heart of Part I. Part II focuses on front propagation. Chapter 4 provides an overview of front propagation in standard reaction–diffusion systems.

reaction-transport equation should have a sound macroscopic or mesoscopic foundation. Second, if the state of the reaction-transport system is spatially uniform, the characteristics of the transport process should play no role in the evolution of the density. For $\rho(x,t)$ $\rho(t)$, the reaction-transport equation
